Executive Summary

Rapid Cortex sits across two distinct but related markets. Core competes in 911 dispatch and public safety decision support — a large, fast-consolidating market where well-funded AI entrants are racing legacy CAD incumbents to own the full call-to-courtroom chain. Venue & University competes in a smaller, faster-growing, and far less consolidated niche: frictionless, no-app incident reporting for campuses and large venues. The two markets call for different competitive postures, and this analysis treats them separately before making the case for running them as one platform.

Core, in brief

Computer-aided dispatch is a \$2.3–2.5B market growing ~11%/yr; the adjacent NG911 market is \$1.17B growing ~5%/yr. The category is consolidating quickly — Axon's pending \$625M acquisition of Carbyne (folded into Prepared to form "Axon 911") and RapidSOS's \$100M raise (Nov. 2025, \$450M+ total) are the clearest signals. Rapid Cortex's differentiation is structural: it augments existing CAD rather than replacing it, which is a materially lower-risk sell to the mid-market and regional agencies the consolidating giants are built to ignore.

Venue & University, in brief

The headline school/campus security market (\$4.2–4.5B, 2025) is dominated by hardware — cameras and access control — and isn't Rapid Cortex's real market. The relevant slice is software-based incident communication, closer to the \$1.0–1.1B "education security" software segment growing ~10.6%/yr. Every direct competitor identified — Rave (Motorola-owned), STOPit, Navigate360/P3 Campus, SaferWatch — requires an app download or account registration to file a report. Rapid Cortex's QR/NFC/SMS model requires neither, which directly answers a documented adoption-friction problem in this category.

What this means for the board

- Core is the larger, more capital-intensive market with the more dangerous competitive dynamics — well-funded entrants are buying their way into full-stack platforms. Rapid Cortex's complement-not-replace position is real, but it needs continual reinforcement as incumbents bundle AI into existing CAD contracts at no incremental cost to the customer.
- Venue & University is the more open market — the single most direct competitor (Rave) is a feature inside a much larger company's portfolio, not its core focus. The zero-friction reporting wedge is defensible and easy to demonstrate in a sales cycle.
- Motorola Solutions is the one competitor that shows up in both markets — dominant in CAD/NG911 via its core business, and present in Venue & University via its Rave acquisition. It is the single name worth tracking most closely across both product lines.
- The two product lines share infrastructure, a sales motion into overlapping buyer relationships (campus PD and the county 911 center serving the same town; a city's PSAP and a city-owned venue), and a revenue-cycle profile that diversifies away from the long, lumpy capital cycles typical of 911 procurement.

1. Core — 911 / Public Safety Answering Point Market

1.1 Market definition and sizing

Rapid Cortex Core does not compete in the full CAD or records-management category — it is explicitly designed to enhance, not replace, an agency's existing CAD. The categories below are the closest available third-party sizing for the surrounding market; Rapid Cortex's directly addressable slice is the AI-assisted call-handling and decision-support layer that sits on top of this infrastructure, which every cited source identifies as the fastest-growing piece of each category.

Segment	Current size	Forecast	CAGR	Source
Computer-Aided Dispatch (CAD), global	\$2.26–2.46B (2024/25)	\$4.31–4.68B by 2030/31	~11–11.3%	Grand View Research; Mordor Intelligence
Next Generation 911 (NG911), U.S.	\$1.17B (2025)	\$1.51B by 2030	~5.2%	Frost & Sullivan
Law Enforcement Software, global (broader category)	\$22.05B (2026)	\$39.19B by 2032	~9.8%	Research and Markets

Figures are independent third-party market-research estimates; methodology and scope vary by publisher. See Methodology & Sources, p. 14.

1.2 Growth drivers

- NG911 migration is approaching saturation — Frost & Sullivan estimates U.S. population coverage under closed NG911 contracts rises from 76.1% (year-end 2025) to 98.4% by year-end 2030, shifting spend from new buildout to platform and analytics layers on top of the new IP-based infrastructure.
- AI-assisted call-handling and transcription is moving from differentiator to baseline procurement expectation across nearly every vendor in this market, from RapidSOS's Harmony to Motorola's and Tyler's agentic add-ons to existing CAD/RMS suites.
- Text, photo, and video to 911 is increasing data volume per incident faster than call volume is growing, which is the direct driver behind decision-support tools whose job is separating signal from noise during an active call — Rapid Cortex's core value proposition.
- Active-shooter and mass-casualty incident frequency continues to sustain political and budget urgency for modernization, independent of underlying call-volume trends.

1.3 Competitive landscape

The defining trend of the last twelve months is consolidation toward full-stack, AI-native platforms that aim to own every step from the first call to courtroom evidence:

Competitor	Scale / funding	Core offering	Position vs. Rapid Cortex
RapidSOS	\$450M+ raised; \$100M round Nov. 2025 (Apax Digital); ~\$111M revenue; 22,000+ agencies	Device-data network + AI triage (“Harmony”)	Data-layer play, not a dispatcher-facing console. Potential integration partner as much as competitor.
Axon 911 (Carbyne +	Axon acquiring Carbyne for \$625M (announced late 2025,	Cloud-native call handling + AI, integrated	The clearest “full-stack” competitor — explicitly

Competitor	Scale / funding	Core offering	Position vs. Rapid Cortex
Prepared)	closing Q1 2026); combined with Axon's existing Prepared acquisition	into Axon Evidence	building call-to-evidence-to-courtroom. Backed by Axon's existing law-enforcement distribution.
Motorola Solutions	Public company; owns CAD/CommandCentral/Vesta, recently acquired Exacom (recording)	Incumbent CAD, NG911 call-handling equipment, recording	Dominant incumbent with the deepest existing agency relationships. Also owns Rave Mobile Safety — see Section 2.
CentralSquare / Tyler Technologies	Established public-sector software vendors	Legacy CAD/RMS, now layering in agentic AI (e.g., “Centerline AI”)	Slower-moving but deeply entrenched; AI add-ons compete directly with Rapid Cortex's core pitch inside existing customer accounts.
Mark43	Venture-backed, cloud-native	Cloud CAD/RMS for law enforcement and multi-agency centers	Closer to a CAD replacement than a complement — different sales motion, occasionally the same buyer conversation.

Read for the board

Three of the five names above have raised or been acquired for nine-figure sums in roughly the last year. That capital is funding a race to bundle call-handling, AI triage, video, and evidence management into one contract — which is precisely the rip-and-replace proposition Rapid Cortex Core is built to avoid asking agencies to accept. That positioning is a real advantage with mid-market and regional PSAPs today; it will need continual reinforcement as incumbents add AI features into existing CAD contracts at no incremental price to the customer.

1.4 How Rapid Cortex monetizes this market

Confidential — internal figures, shown here for board financial-modeling purposes only.

Plan	Target agency profile	Indicative annual range
Essential	Small municipalities, single-site PSAPs	\$33,600–\$72,000
Professional	Mid-market, growing agencies	\$102,000–\$216,000
Command	Large agencies, regional/command-center operations	\$270,000–\$600,000
Enterprise / Statewide	Multi-agency, countywide, or statewide deployments	\$720,000–\$10M+

Source: internal pricing schedule (Exhibit B, Master Services Agreement). Tier ranges reflect seat count and call volume; CAD integration is priced separately and is the one line item the internal pricing guide flags as not to discount.

1.5 Risks and watch items

- Funding asymmetry: RapidSOS and Axon's combined platform have access to capital an order of magnitude beyond anything in Rapid Cortex's current stage — differentiation has to be sustained on positioning and integration depth, not feature-race spending.
- CAD incumbents bundling AI features into existing contracts at no extra charge erodes the standalone value of an add-on decision-support layer over time.
- NG911 nearing saturation (98% by 2030) means the long-term growth driver shifts from new infrastructure spend to platform/analytics spend — exactly the layer Rapid Cortex competes in, which is the right place to be positioned but raises the bar on proving ROI rather than riding a buildout wave.

2. Venue & University Market

2.1 Market definition and sizing — read this before the table

The headline “school and campus security” figures below are dominated by physical-security hardware — cameras, access control, weapons detection — which is not Rapid Cortex's market and should not be cited as Rapid Cortex's addressable opportunity. The closer analog is the software/communication layer: anonymous and identified incident reporting, two-way chat, and location intelligence, which EdWeek Market Brief and Mordor Intelligence both treat as a distinct, smaller sub-segment growing inside the larger hardware-led market. The same caution applies to stadium/venue security figures, which vary by 5–10x across vendor reports depending on whether physical staffing, access control hardware, and analytics software are all bundled into one number — treat the ranges below as directional, not precise.

Segment	Current size	Forecast	CAGR	Source
School & Campus Security, global (hardware + software)	\$4.2–4.5B (2025)	\$9.1–22.7B by 2033/34	8.5–20.6%	Business Research Insights; Verified Market Reports
Education Security, global (software-inclusive)	\$1.01–1.10B (2025/26)	\$1.82B by 2031	~10.6%	Mordor Intelligence
Stadium / Venue Security, global	\$1.5–\$16B (2025) — wide variance by scope	Roughly 2–2.5x by 2030–33	9–15%	Multiple vendor reports — see Methodology
Crowd Management & Event Security, global	\$2.1–2.5B (2025/26)	\$12.9B by 2035	~20%	Research Nester

Figures are independent third-party market-research estimates; methodology and scope vary materially by publisher, particularly for stadium/venue security. See Methodology & Sources, p. 14.

2.2 Growth drivers

- Federal and state safety-grant funding (e.g., the \$73M COPS Office STOP School Violence Program, \$83M BJA STOP pool) is compressing technology refresh cycles and steering district budgets toward integrated reporting and communication tools, not just cameras.
- Title IX and Clery Act expectations at universities, and state-level anonymous-reporting mandates at the K-12 level, are turning “see something, say something” infrastructure from a nice-to-have into a compliance-adjacent requirement.
- Elevated venue-threat posture: DHS has designated all 78 U.S.-hosted 2026 World Cup matches as SEAR I or II events, with an estimated \$625M in incremental security spend across the eleven U.S. host cities alone — a visible proof point of the investment cycle large venues are already in.
- A documented adoption-friction problem motivates Rapid Cortex's specific approach: even where camera and access-control hardware is in place, EdWeek Market Brief data shows 39% of those systems aren't integrated with communications infrastructure, and every named competitor below requires an app download or account registration before a student, fan, or staff member can file a report.

2.3 Competitive landscape

Competitor	Ownership / focus	Core offering	Reporting method	Position vs. Rapid Cortex
Rave Mobile Safety	Owned by Motorola Solutions	Guardian app, AppArmor anonymous tipping, Panic Button mass notification	App download + account registration	The most direct, most resourced competitor — backed by Motorola's existing campus and municipal relationships.
STOPit Solutions	Independent	Anonymous reporting + 24/7 staffed Incident Response Center	App / web	Strong on staffed triage; narrower toward bullying/harassment than broad safety reporting.
Navigate360 (P3 Campus)	Independent, rolled up several legacy tip-line brands	Anonymous tip line + broader threat-assessment suite	App / web / phone	Deep in K-12 threat-assessment workflow; less focused on the venue/stadium side.
SaferWatch	Independent	Incident reporting, mass notification, panic alerts	App	Positions itself as broader/multi-sector (schools, municipalities, healthcare, corporate) than single-purpose competitors.
Omnilert / Regroup / Everbridge	Independent (each)	Mass notification (outbound alerting)	App / SMS / email blast	Outbound-alert-first, not inbound-reporting-first — often the incumbent ENS Rapid Cortex integrates alongside rather than replaces.
Centegix	Independent	Wearable panic-button hardware + real-time location system	Hardware badge	Hardware-first; complements rather than directly competes with a reporting/communication layer.

Read for the board

Every named direct competitor requires installing an app and creating an account before a report can be filed. Rapid Cortex's QR-code, NFC-tap, or SMS-text model requires none of that — a real, demonstrable difference directly against the adoption-friction problem documented in the category, not a marketing claim. Rapid Cortex also explicitly integrates alongside an existing ENS (Rave, Omnilert, Regroup) rather than asking a campus or venue to rip one out, which lowers sales-cycle friction versus a head-on replacement pitch.

Watch this name across both product lines

Motorola Solutions is the dominant incumbent in Core (CAD, NG911, call-handling equipment) and, via its Rave acquisition, a real presence in Venue & University. It is the single competitor most likely to show up in board-level competitive discussion across both halves of this analysis, and the one worth the most ongoing intelligence-gathering.

2.4 How Rapid Cortex monetizes this market

Confidential — internal figures, shown here for board financial-modeling purposes only.

Vertical	Pricing model	Notes
Campus / University	\$1.40 per enrolled student, per year	Annual contract value calculated from official institutional enrollment census at onboarding.
Venue	Tiered (Tier 1–4) by maximum capacity	Tier assignment driven by venue max-capacity figure collected during onboarding.

Source: internal RC Campus & Venue Onboarding Guide. Both models are simple, predictable, and easy for a buyer to budget against — a contrast to the opaque enterprise quoting common among the hardware-led incumbents above.

2.5 Risks and watch items

- Motorola's ownership of Rave gives the most direct competitor in this category access to a much larger company's sales force, balance sheet, and existing agency relationships — the same dynamic flagged in Core.
- The headline market is hardware-dominated, which means software-only positioning is competing for a smaller line item inside a district or venue's total security budget; sales cycles likely require explicit buyer education on why this is a distinct budget category from cameras and access control, not a replacement for them.
- K-12 deployments carry heightened data-handling scrutiny (FERPA, state-level student-privacy statutes) that does not apply the same way to the venue side of this vertical — worth keeping the compliance posture for each sub-vertical distinct rather than treating “Venue & University” as one undifferentiated compliance profile.

3. Why Both, Together — the Platform Thesis

Core, Venue & University are different markets with different competitive dynamics, but they share enough structure to justify running them on one platform rather than as two unrelated bets:

- Overlapping buyers: a county 911 center and the public university in the same county; a city's PSAP and a city-owned stadium or arena. The same advisory-board introductions and the same procurement relationships frequently touch both product lines.
- Shared infrastructure: QR/NFC/SMS intake, role-based dashboards, and audit/compliance tooling are largely the same underlying platform with vertical-specific theming and routing — the incremental engineering cost of a second or third vertical is materially lower than building each from scratch.
- Revenue-cycle diversification: Core procurement (especially Command and Enterprise/Statewide tiers) tends to follow long, capital-budget-driven cycles. Campus's per-student pricing and Venue's per-capacity tiering are smaller, faster-moving contracts that can smooth overall revenue timing rather than concentrating it in a small number of long sales cycles.
- A consistent point of competitive intelligence: Motorola Solutions is the one name that recurs across both halves of this analysis — worth a standing watch item rather than a one-time note in two separate sections.

4. Discussion Questions for the Board

Framed for the relevant advisory lanes — intended to start discussion, not to imply a predetermined answer.

- GTM / procurement (GovTech lane): given the consolidation in Core, is mid-market/regional positioning durable as a long-term strategy, or a beachhead that needs a stated plan to move upmarket before incumbents' bundled AI features close the gap?
- Finance / PE lane: how should the per-student and per-capacity pricing models in Venue & University be weighted in a blended valuation narrative against Core's larger but lumpier enterprise contracts?
- AI governance / legal lane: does the compliance posture need to formally diverge between K-12 campus deployments (FERPA-driven) and venue deployments (no comparable student-privacy regime), rather than presenting one unified “campus and venue” compliance story externally?
- 911 operations / APCO lane: which specific mid-market PSAP profile (seat count, call volume, current CAD vendor) is the highest-probability next reference customer, given the competitive map in Section 1.3?
- Marketing lane: the zero-friction QR/NFC/SMS differentiator in Venue & University is concrete and demonstrable — is it currently the headline message in campus/venue-facing materials, or is it under-emphasized relative to its competitive value?

Methodology & Sources

This analysis synthesizes publicly available, third-party market-research and trade-press sources gathered in June 2026, alongside Rapid Cortex's own internal pricing and product documentation (cited inline as "source: internal"). It is directional market intelligence intended to support board-level strategic discussion — it is not a substitute for a commissioned, primary market study, and no figure below should be treated as audited.

A general caution on market-sizing reports in this space: vendor and analyst market-research firms frequently define category scope differently (e.g., whether physical security hardware, staffing services, and software are bundled into one figure), which produces wide variance even for the same nominal market — most visibly in the stadium/venue security figures cited in Section 2.1, which range roughly 5–10x across sources depending on scope. Where this variance was material, it is flagged explicitly in the relevant section rather than resolved by picking a single number.

RAPID CORTEX

Feature-vs-Feature Competitive Comparison

Companion to the Core / Venue & University Market Analysis, June 2026 — prepared for the Advisory Board.

How to read this: every cell reflects a specific public source — a product page, press release, or trade-press article current as of June 2026 — or Rapid Cortex's own internal product documentation for the Rapid Cortex column. Where no public source confirms a competitor either has or lacks a capability, the cell reads “Not public” rather than “No.” That is a statement about what is publicly documented, not a confirmed gap in the competitor's product — several of these companies likely have unannounced or undocumented capabilities in the same areas.

Legend:

Yes	Partial	No	Not public
-----	---------	----	------------

Core — 911 / Public Safety Answering Point

Feature	Rapid Cortex	RapidSOS	Axon 911 (Carbyne + Prepared)	Motorola Solutions	CentralSquare / Tyler	Mark43
Augments existing CAD — no rip-and-replace required	Yes	Yes	No — full-stack replacement model	No — sells the CAD itself	No — sells the CAD itself	No — sells the CAD itself
CAD-vendor-agnostic (works across multiple CAD brands)	Yes	Yes	No	No	No	No
AI-assisted live call transcription	Yes	Yes	Yes	Yes	Yes	Not public
Real-time language translation	Yes	Yes	Yes	Not public	Not public	Not public
Live video / photo / multimedia caller intake	Yes	Yes	Yes	Yes	Partial — via certified partners	Not public
Human-approval gate before any CAD write-back	Yes	Not public	Not public	Not public	Not public	Not public
AI-recommended unit / dispatch assignment	No — SOP-aligned intake assist only, not unit recommendation	Not public	Partial — triage-focused, not unit recommendation	Yes	Yes	Not public
Cross-jurisdiction / cross-agency real-time data sharing	Yes	Yes — “Real-Time Interoperability,” launched Jan. 2026	Not public	Not public	Not public	Not public
Drone-as-first-responder / connected-device data ingestion	No — not in current feature catalog	Yes	Not public	Not public	Not public	Not public

Axon 911, Motorola, CentralSquare/Tyler, and Mark43 each sell a full CAD/RMS platform — a different product category than Rapid Cortex Core. Rows 1–2 reflect that category difference rather than a feature gap on either side.

Venue & University

Feature	Rapid Cortex	Rave Mobile Safety	STOPit Solutions	Navigate360 (P3 Campus)	SaferWatch
No app download required to file a report	Yes — QR / NFC / SMS, no install	No — app + account registration required	Partial — web-based reporting option also offered	Partial — web and phone tip-line options also offered	Partial — web-based platform also offered
Physical on-site tap/scan reporting (QR or NFC signage)	Yes	No	Not public	Not public	Not public
Two-way chat with reporter after submission	Yes	Not public	Yes — “STOPit Messenger”	Yes — “Two-Way Dialogue”	Yes — “secure two-way messaging”
Automatic GPS location capture on text/report	Yes	Partial — emergency-call context, not anonymous tips	Not public	Not public	Not public
Designed to integrate alongside an existing ENS rather than replace it	Yes — stated design principle	No — is itself an ENS	No — is itself a tip-line platform	No — is itself a tip-line platform	No — is itself a platform
24/7 staffed incident response / triage service included	No — routes directly to agency's own console	Not public	Yes — in-house Incident Response Center	Not public	Not public
Formal threat-assessment workflow suite (beyond intake)	No — not in current feature catalog	Not public	Not public	Yes	Not public
Outbound mass emergency notification	No — not in current feature catalog	Yes — “Panic Button”	Not public	Not public	Yes

Omnilert, Regroup, Everbridge, and Centegix are intentionally excluded from this matrix. The first three are outbound mass-notification platforms and Centegix is wearable panic-button hardware — none compete directly on inbound incident reporting, the category this matrix compares. Rapid Cortex is designed to integrate alongside the mass-notification tools, not compete with them; see Section 2.3 of the full Market Analysis.

What this exercise actually surfaces

The honest value of a feature-level comparison is in the gaps it finds on both sides, not just the wins:

- Confirmed differentiators: no other named Core competitor combines CAD-agnostic integration with an explicit augment-not-replace design — RapidSOS is CAD-agnostic but doesn't share the human-approval write-back gate; the four full-stack vendors aren't CAD-agnostic at all. In Venue & University, no named competitor documents physical QR/NFC tap-to-report signage — every one of them is app- or web-based.

- Real gaps worth a deliberate answer, not a surprise in a board meeting: Rapid Cortex Core has no AI-recommended unit/dispatch assignment, while Motorola and CentralSquare/Tyler both do. Venue & University has no 24/7 staffed triage service (STOPit's strongest claim), no formal threat-assessment suite (Navigate360's specialty), and no outbound mass-notification capability of its own — which is a deliberate design choice given the integrate-alongside-ENS positioning, but worth stating as a choice rather than letting it read as an oversight.
- Heavily “Not public” categories (translation, multimedia intake among the smaller Core players; most granular Venue & University rows for Rave and STOPit) are exactly where a sales or competitive-intelligence conversation with a prospect who has evaluated those vendors would close the most uncertainty in this matrix — worth treating as a research backlog, not a dead end.
