Set Up Your NFC Business Card

NexCort iQ employees · fill out the dashboard first, then write the chip with our app or Chrome on Android

After your physical NFC card arrives: (1) finish your business card on the NexCort iQ dashboard, then (2) write your permanent tap link onto the chip with the **NexCort iQ Mobile** app *or* **Chrome on Android**. Either write method works.

What gets written? Your permanent tap link — it looks like `https://www.nexcortiq.us/c/` plus a short ID (example: `https://www.nexcortiq.us/c/abc123`). A tap opens your public contact page. Do **not** write the share-page link that looks like `https://www.nexcortiq.us/card/yourname` (QR / share only). Editing your details later does not require rewriting the chip. STEP 1 · DASHBOARD — FILL OUT YOUR BUSINESS CARD

1. On any browser, open `https://app.rapidcortex.us/rc-admin/profile/business-card` (or the link your manager sent). Sign in with your NexCort iQ work login.
2. Enter or update name, title, photo, phone, email, and links → **Save**.
3. **Publish** / **Activate** so your public page is live.
4. Confirm an NFC tag is linked to you: open **Business Cards** → **NFC Card Management** (or the **NFC** tab on your card). You should see your permanent tap link (`nexcortiq.us/c/…`). If it says **No tag assigned**, ask your admin before writing.

STEP 2 · WRITE THE CHIP — PICK APP OR CHROME

Do this only after Step 1. If tapping the card already opens your public page, skip to the checklist.

Option A — NexCort iQ Mobile

1. Install the app (links at bottom) if needed.
2. Sign in with your NexCort iQ work login (`rcsuperadmin`, `rcadmin`, `rcitadmin`, or `salescontractor`).
3. Open **Business Card NFC**: iPhone Settings (Marketing) → **Business Card NFC**; or Venue/Campus Codes → **Business Card NFC**; or iPhone agency select → **Business Card NFC**.
4. Select your card → start programming.
5. Hold the NFC area to the phone until success (Android: upper-back center; iPhone: top edge). Remove a thick case if needed.
6. When the app confirms, status is marked programmed. Tap any phone to verify, then you're done.

Option B — Chrome on Android (Web NFC)

1. **Open Chrome on Android only.** Safari, Firefox, and all desktop browsers cannot write NFC. Turn NFC on: **Settings** → **Connected devices** → **NFC** → **On** (wording may vary by phone).
2. In Chrome, go to `nexcortiq.us` / your NexCort iQ app URL, sign in, then open **Business Cards** → **NFC Card Management**.
3. Find **your** card row → tap **Write NFC** / **Write to tag**. Chrome asks you to bring the tag close.
4. Hold the blank NFC card **flat** against the **upper-back center** of the phone (where the NFC antenna usually sits). Hold completely still. **Remove the phone case first** if the write does not start — that is the most common failure.
5. Wait for Chrome to vibrate and show success (usually 1–2 seconds). Do not move the card until you see it.
6. **Tap to verify:** with a second phone (any phone), tap the card. It should open your public profile via the permanent tap link (`nexcortiq.us/c/` + ID). Wrong page? You may have written a share link — rewrite using the tap link, not `…/card/yourname`.
7. Back in NFC Card Management, status may update automatically. If not, click **Mark programmed**, then **Mark verified** after the tap-test passes.

Chrome note: Most common failure = phone case blocking the NFC antenna. Remove the case and retry. iPhone Safari cannot write — use Option A (app) or borrow an Android for Option B.

	Step	Done
☐	Dashboard: details saved · Published · tap link visible in NFC Card Management / NFC tab	
☐	Wrote chip with **app** or **Chrome** (or tap already worked)	
☐	Second-phone tap opens my public page · Mark programmed / verified if needed	

App: Android `play.google.com/store/apps/details?id=us.rapidcortex.app` · iPhone (unlisted) `apps.apple.com/us/app/nexcort-iq-mobile/id6811733550` · Lost card → tell your admin to revoke the tag and send a replacement.
