

NexCort iQ x Midnight Security

Partnership one-pager | Confidential | September 2026

THE PROBLEM

U.S. 911 centers operate at ~75% staffing while handling ~240M calls/year. Roughly 36M are alarm calls; industry estimates put ~95-99% of those as false. That noise burns capacity PSAPs no longer have. Midnight reduces false activations at the home. NexCort iQ makes verified calls actionable in the console.

MIDNIGHT SECURITY

Source of truth at the premises

- AI room sensors - no cameras
- False-alarm reduction + privacy-first
- Open-source HA dispatch handoff
- Kickstarter / Fall 2026

NEXCORT iQ

Intelligence inside the PSAP

- Real-time incident + address intel
- CAD-adjacent workspace (no CAD replace)
- Verified-alarm incident cards
- Agency-scoped, CJIS-aware design

Payload (illustrative): agency routing key, lat/lon, address, confidence score, room/zone, privacy-safe flags, event id. NexCort creates a high-trust incident - not another anonymous alarm CFS - with address intelligence.

WHY PARTNER

- Complementary, not competitive - Midnight never needs a PSAP console; NexCort never builds home hardware.
- Shared narrative - staffing crisis solved from both ends: fewer junk calls in, better context on real ones.
- Fast technical path - Midnight's open handoff pattern maps cleanly to NexCort incident + address intelligence.
- Agency value - measurable drop in false-alarm load + faster verified-alarm handle time.

PILOT ASK

Scope: 1 agency | 60-90 days | Midnight verified alarms -> NexCort console card (webhook).

Success: % of Midnight events that avoid false CFS; median time-to-context for real events; dispatcher feedback.

Deliverable: thin integration (event -> incident card) + joint case note. No CAD write-back required.

Next step: 20-minute whiteboard to align payload schema and pilot agency criteria.
